

The Right to Vote Means Nothing If Our Votes Aren't Counted Accurately

Good News! The Public Can Oversee Vote Counts
Using a Little-Known Feature of Existing Election Machinery

**Official election results
cannot be trusted.**

The problem goes far deeper than whether the Russian government hacked the 2016 presidential election.

Even votes cast on paper ballots are counted by electronic systems that can be programmed to produce any result.

**The computers that count our
votes can be gamed.**

**We need transparent,
publicly verified elections.
This is achievable with
technology currently in use.**

Newer ballot scanners create a **digital image** of every ballot. It's votes on the *images* that are counted. Digital image files can safely be made public for oversight. And yes, the images can be re-matched with ballots for verification, without violating voter privacy.

In many jurisdictions, we're discovering that elections departments are turning off this security feature!

**But elections officials are
destroying these legally
protected election materials!**

**AUDIT-USA
is working to verify
elections through our
Ballot Images Project.**

**Americans United for Democracy, Integrity,
and Transparency in Elections**
is a non-partisan group of experienced advocates for election transparency. We're patriots who believe elections belong to the people, not to political parties or corporations.

We're taking our strategy
nationwide.

**Join us at
www.AUDITElectionsUSA.org**

**Courts have already ruled in
our favor in Arizona and
Alabama.**

We're looking for opportunities to join with other voting rights groups. Together we must address the entire elections mess, including **voter suppression, gerrymandering, & corporate money.**
